

My name is You Zhou, and as a student who chose both his bachelor and master majors as computer science, I have touched many fields around this area, such as network, database management, data mining, even data visualization. However, the thing attracts me most is software engineering. I cannot say there is no relation with trend of market, but I really take interests in software design since I was an undergraduate student, especially web application. I think designing and developing software which people will use is really a cool thing, which makes me excited and proud. Every time I do something like requirement analysis, I feel interested because I need to consider massive things, to design a beautiful and rational software, or frame. As a student who has taken the course named design of software twice, I am familiar with the workflow in software development and also with some tools like UML. I have also finished some web applications with java, python and javascript. You can find them in my resume or cover letter, or online website. I am also a person with full enthusiasm and attach importance to team work. I believe the whole is greater than the sum of its parts.
